

# Natural History Museum

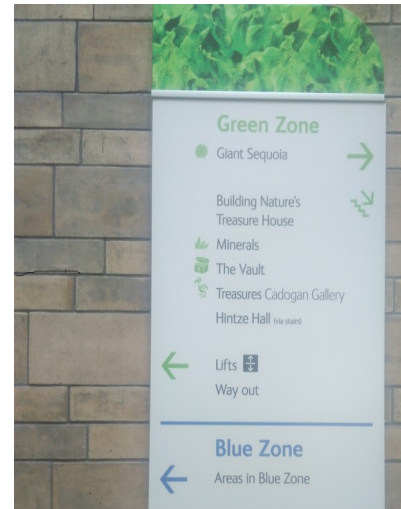

The Natural History Museum was built in London in 1881. It welcomes about 4 500 000 visitors per years and it's famous for its skeleton of whale in the hall.

It's also a monumental buildings and it includes two categories of the Natural History which interested us :

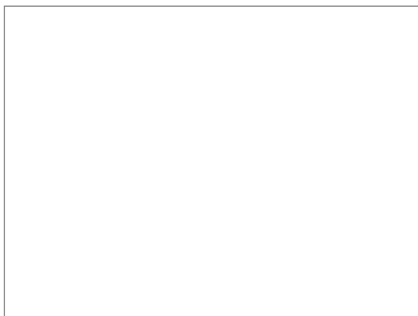

- The vegetal and mineral in green zone
- The ocean in Blue Zone

In the green zone, we really enjoyed the mineral part. Indeed, each mineral have a different color.

There was the mammal part too. It was interesting because the position of the stuffed animals allowed us to see them in an impressionant way. In this part, there were interactives games.

In the blue zone, we enjoyed the shellfish part and the fish part. We saw prehistoric fishes with the skeleton and plastics reproductions.

This museum was beautiful ! We didn't have the time to visit all the museum and we hope that we will can visit it entirely !
