

## **RB3D, the company which assists you in order to protect you**

After our visit to RB3D, we decided to share to you our experience and impressions.

Firstly, this company is specialized in the manufacture of exoskeletons. Indeed, the exoskeletons is a motorized device which is attached to the body to increase physical capacity and comfort. For example, these exoskeletons reduce vibration levels. Moreover, when we visited the company's premises, we saw that the company produces its own robot pieces by using 3D printers.

There are several types of exoskeletons, but we will focus on the Exoviti which is used in vineyards because it was the one who impressed us the most. We had the chance to test this Exoviti, this tool is adjustable according to the person

and pleasant to wear due to this low weight (2kg). The company consists of 10 people, including 7 engineers and 3 technicians. Finally, we met Nicolas who is a computer programmer in this company. His role is to keep himself informed news from their competitors and news exoskeletons. This allow to the company to be update on the exoskeletons market.

We were delighted with this experience, and we thank RB3D for its hospitality and for the snack!
