

# RB3D, an exoskeleton factory

With our class, we had the luck to visit the RB3D business, and we wrote an article about this company :

First, is a company which produce different types of exoskeleton like exoback or even exopush.

We learn that the goal of exoskeleton is to help people who have painful jobs. Indeed, people may have to carry heavy loads or event have bad posture.

Thanks to the boss, we found out that the aim of the exoskeleton is to reduce or even cancel pain due to vibrations of the tool weight, bad position and risks of accident with a modern and simple equipment.

Moreover, thanks to the team, we had the privilege to try the exovity which is made especially for vine makers.

Furthermore, we also learn a lot of things about the items in particular that the English is very important in this job. Indeed, they need English every time to be up to date about the competition or others things.

In conclusion, RB3D is a factory which is still in development but which helps a lot especially people who are working in painful jobs. I hope you will visit this factory because it's very interesting!
